A Review of Research and Data Set Development at NCDC: 1985-2003

David R. Easterling, B. Gleason, D. Wuertz, R. Vose, and T. Karl

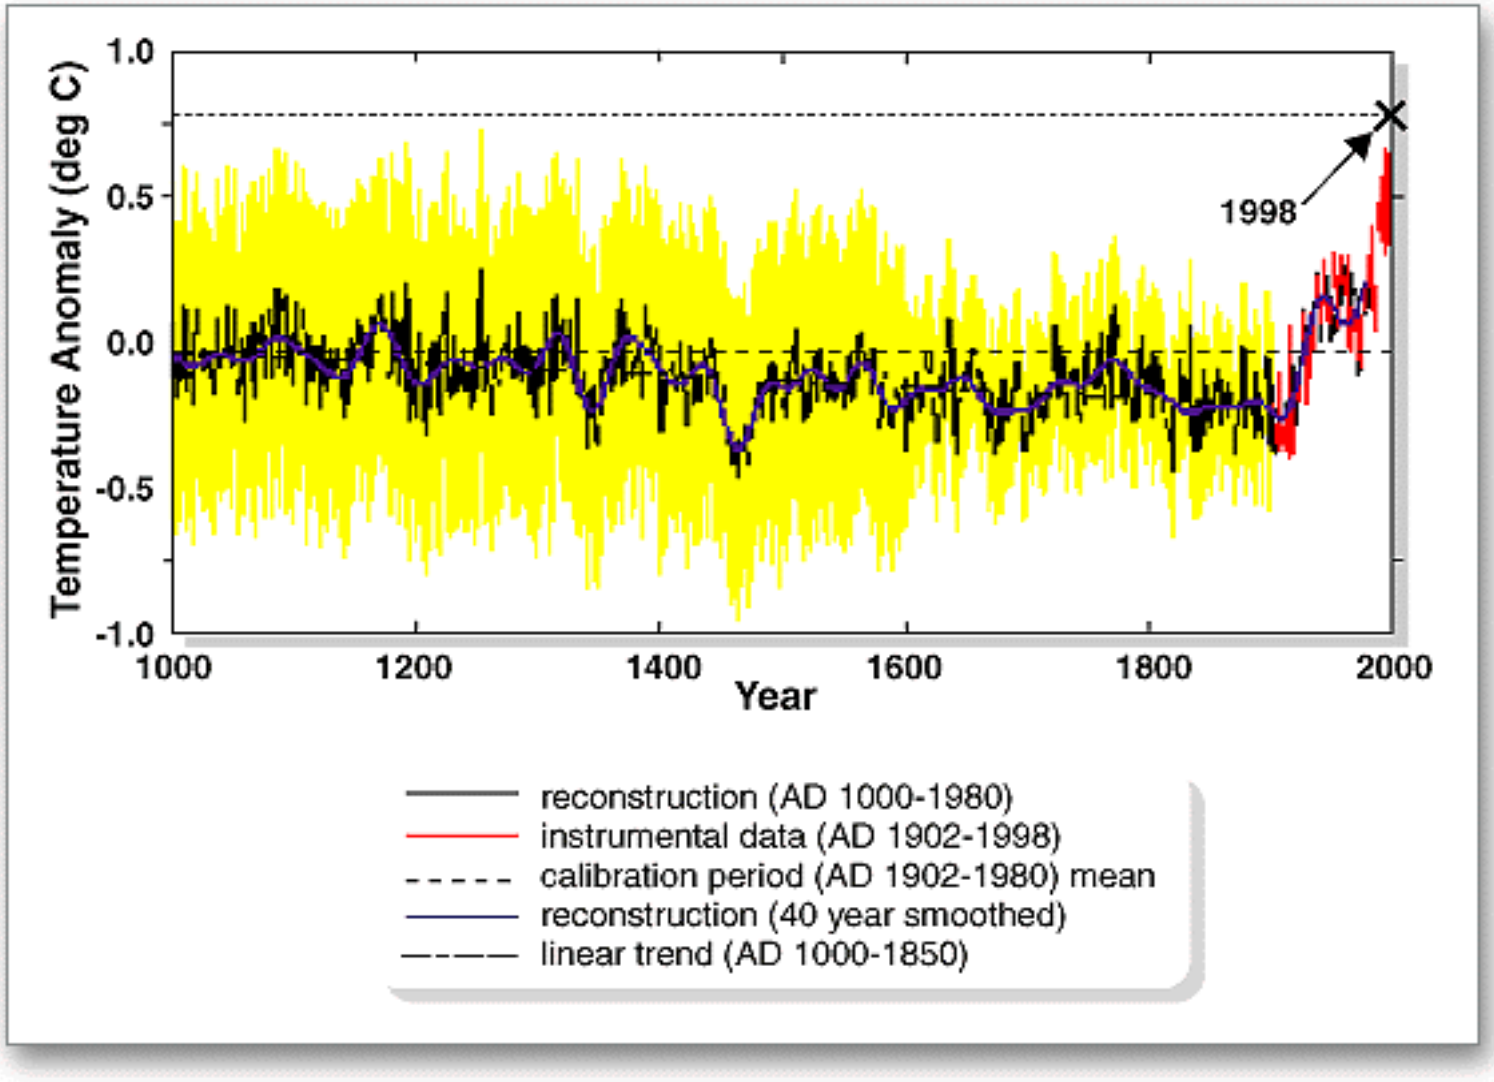
NOAA's National Climatic Data Center

Asheville, NC

Outline

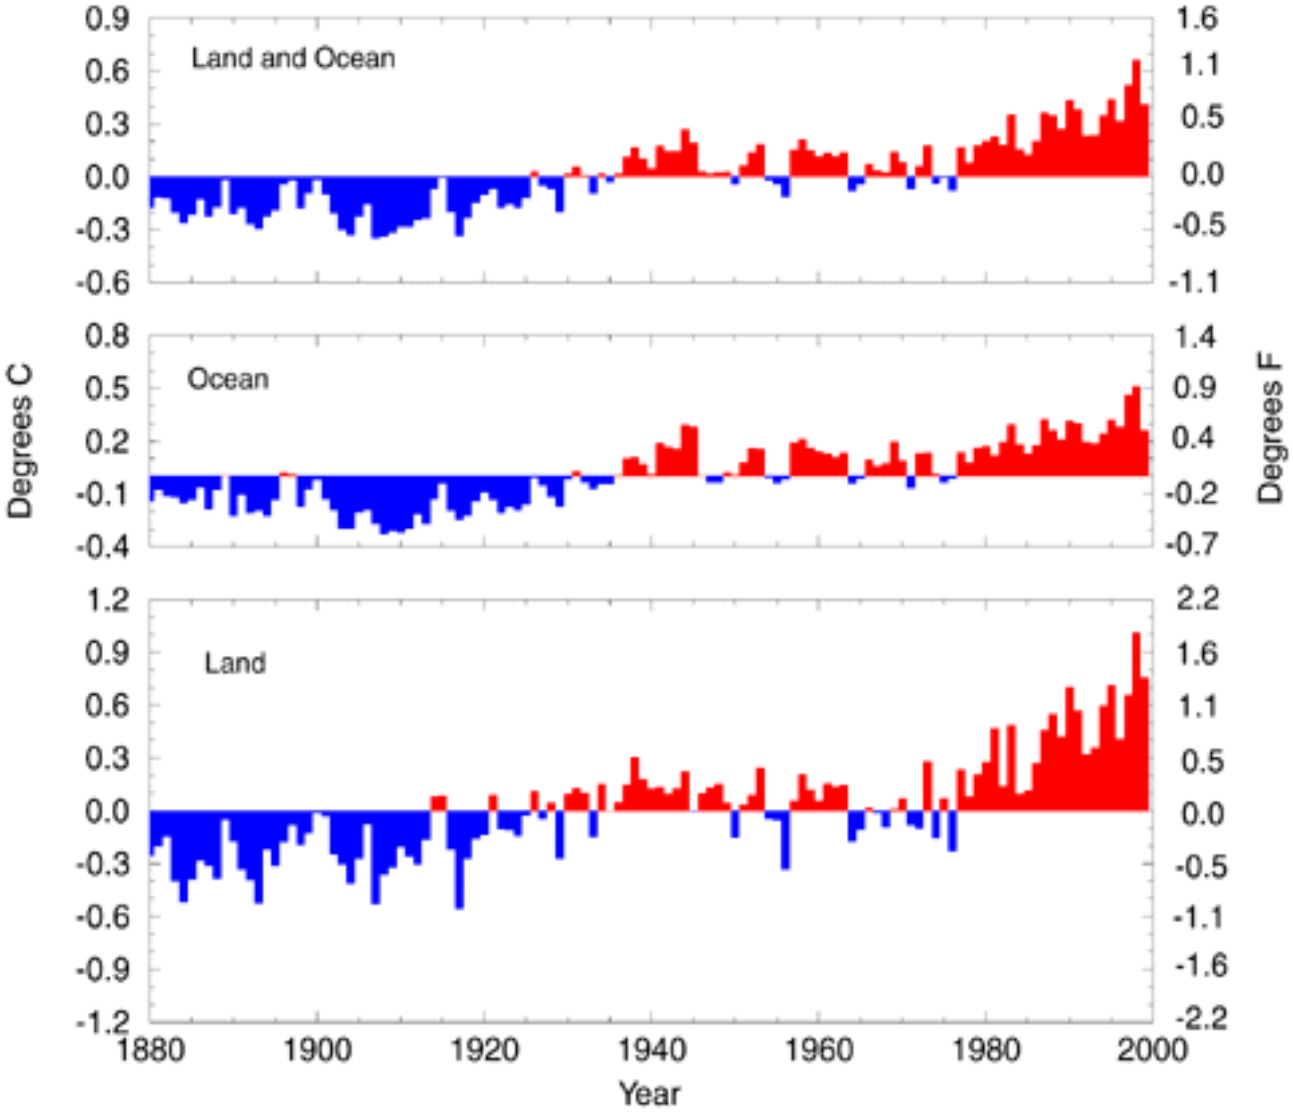
- Evidence of observed warming: is it real?
- Supplemental evidence
- Updated Max/Min/DTR trends for the globe.
- What kinds of days are changing the most, coldest, warmest?
- What kind of confidence can we place in these and other results?

Northern Hemisphere 1000 Year Temperature Reconstruction

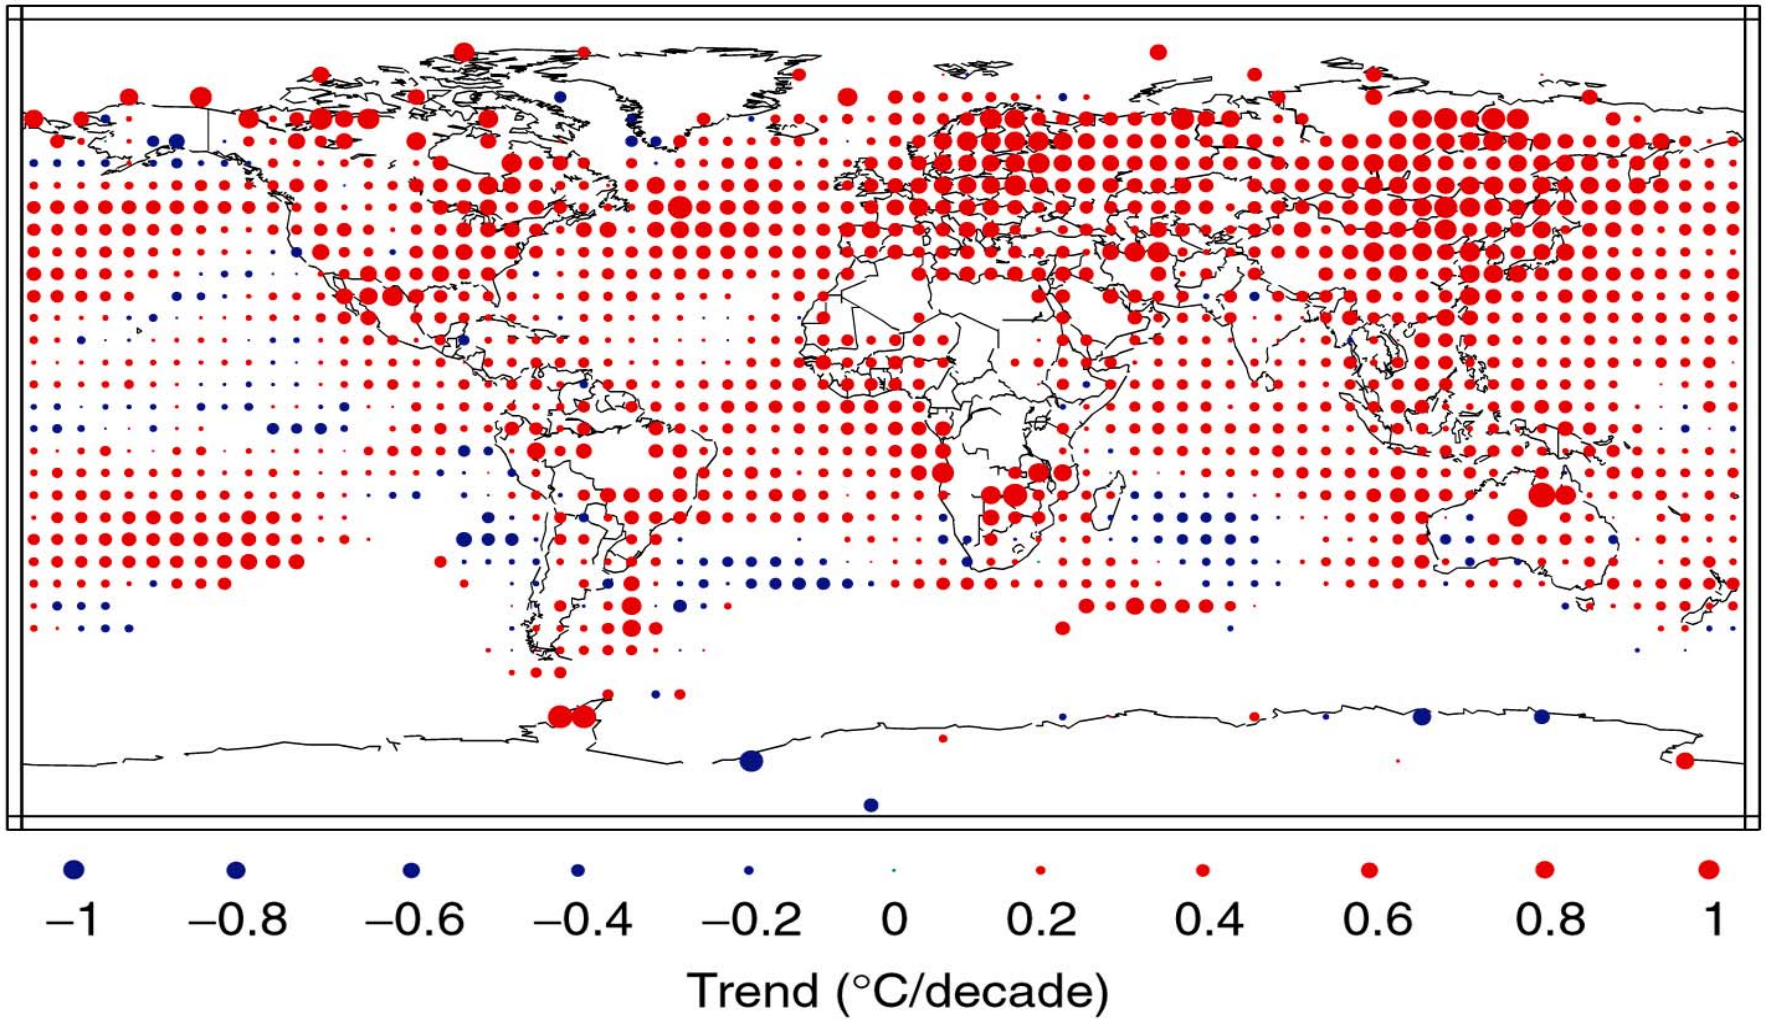


Annual Global Surface Mean Temperature Anomalies

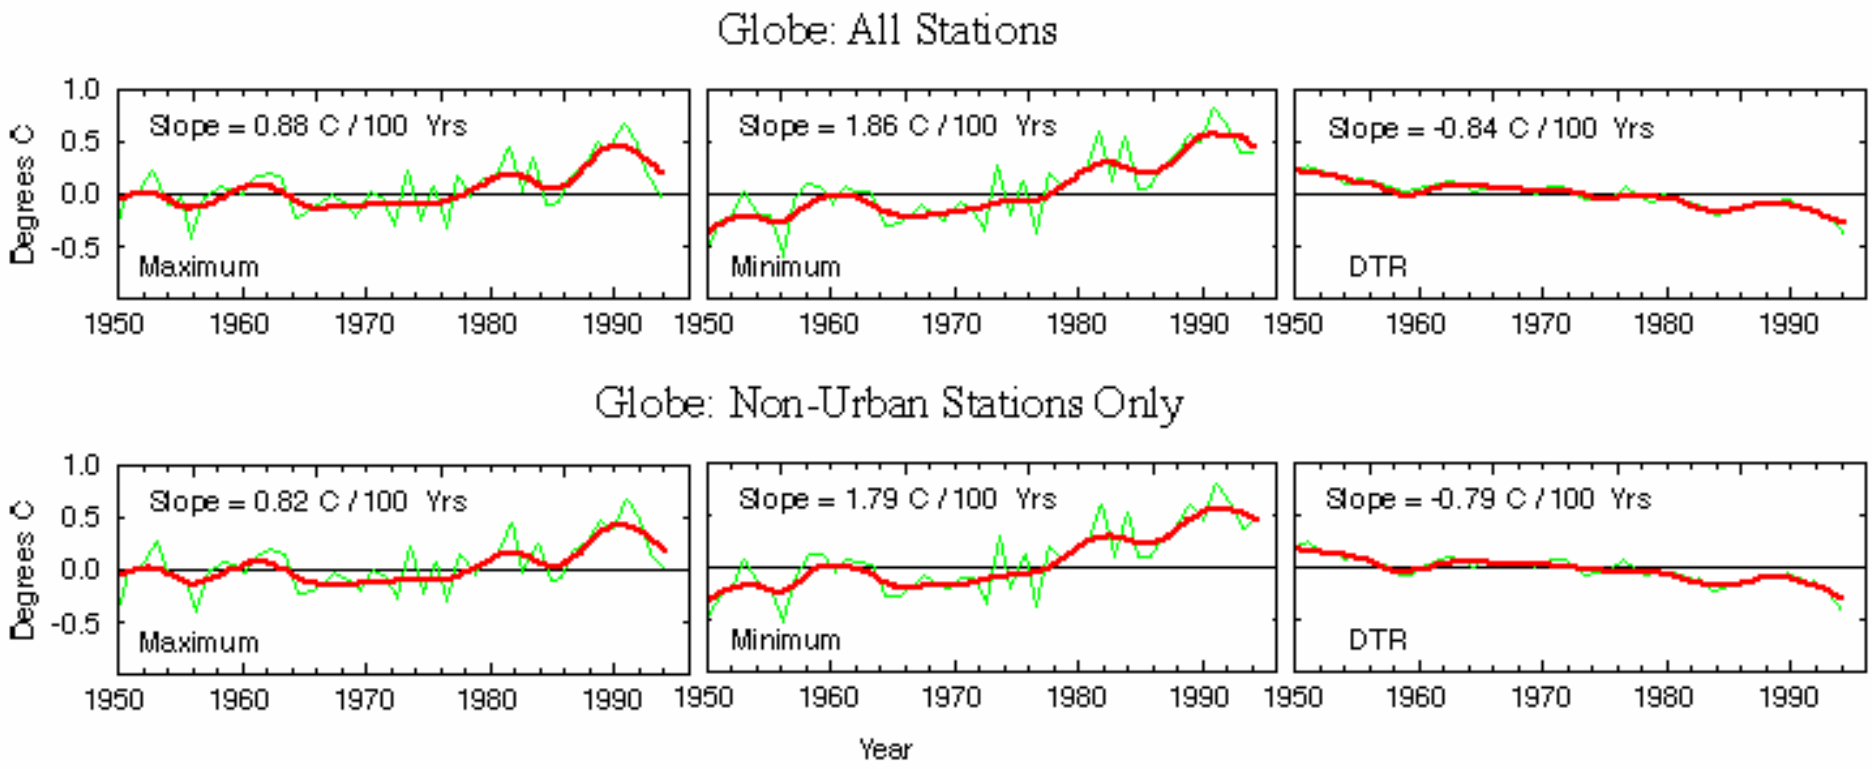
National Climatic Data Center/NESDIS/NOAA



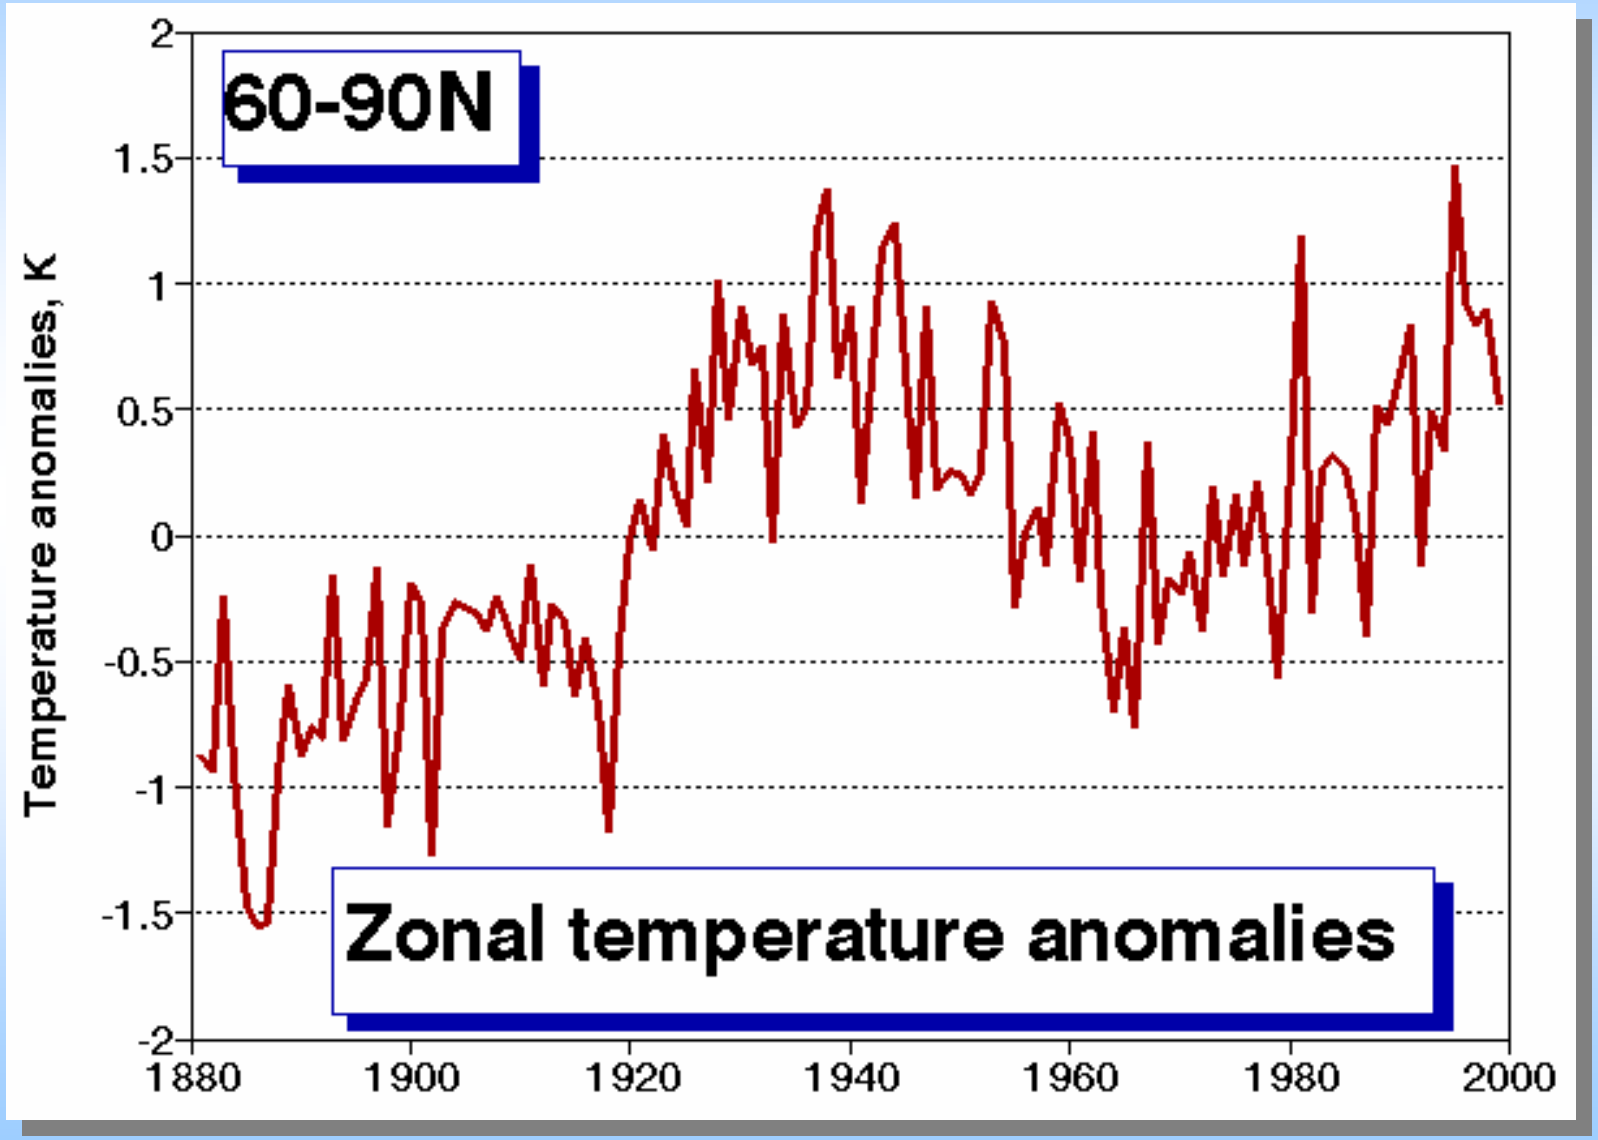
Annual temperature trends, 1976 to 2000



Maximum and Minimum Temperature and Diurnal Temperature Range Trends (Easterling et al., 1997)

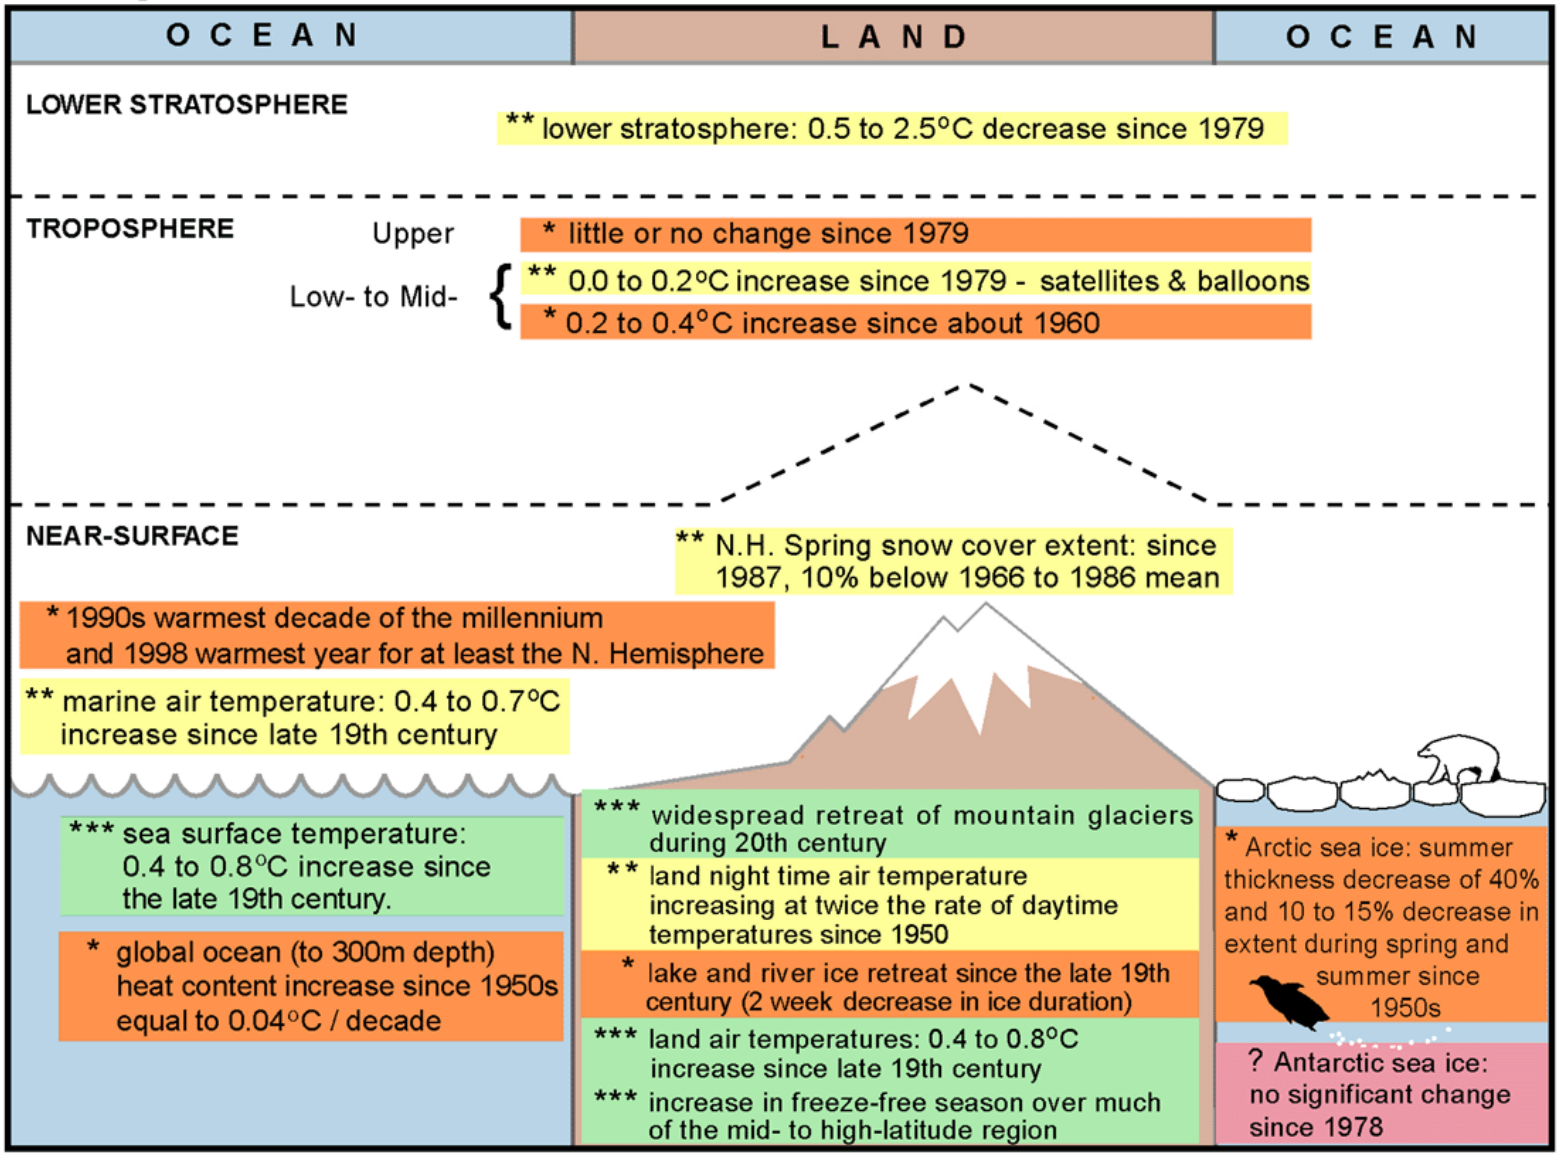


Arctic Annual Temperature Variations



Temperature Indicators

KEY METRIC

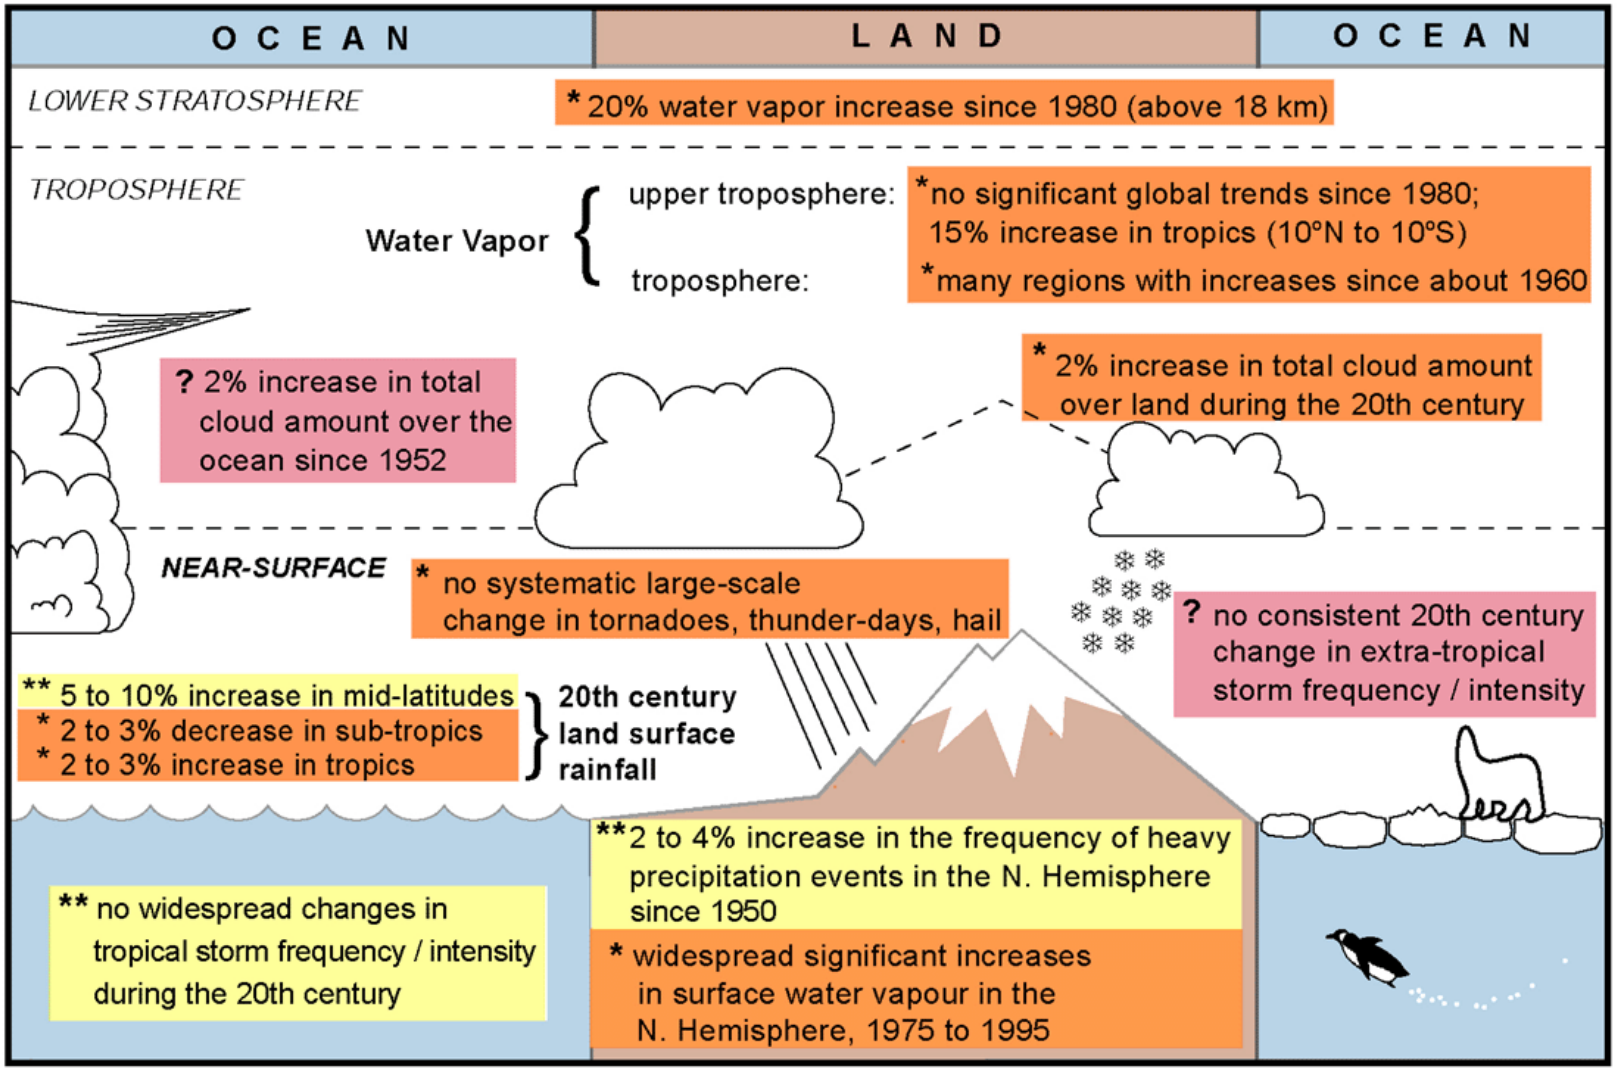


Likelihood:

- *** **Virtually certain (probability > 99%)**
- ** **Very likely (probability ≥ 90% but ≤99%)**
- * **Likely (probability > 66% but < 90%)**
- ? **Medium likelihood (probability > 33% but ≤ 66%)**

Hydrological and Storm-Related Indicators

KEY METRIC



Likelihood:

*** Virtually certain (probability > 99%)
** Very likely (probability ≥ 90% but ≤ 99%)
* Likely (probability > 66% but < 90%)
? Medium likelihood (probability > 33% but ≤ 66%)

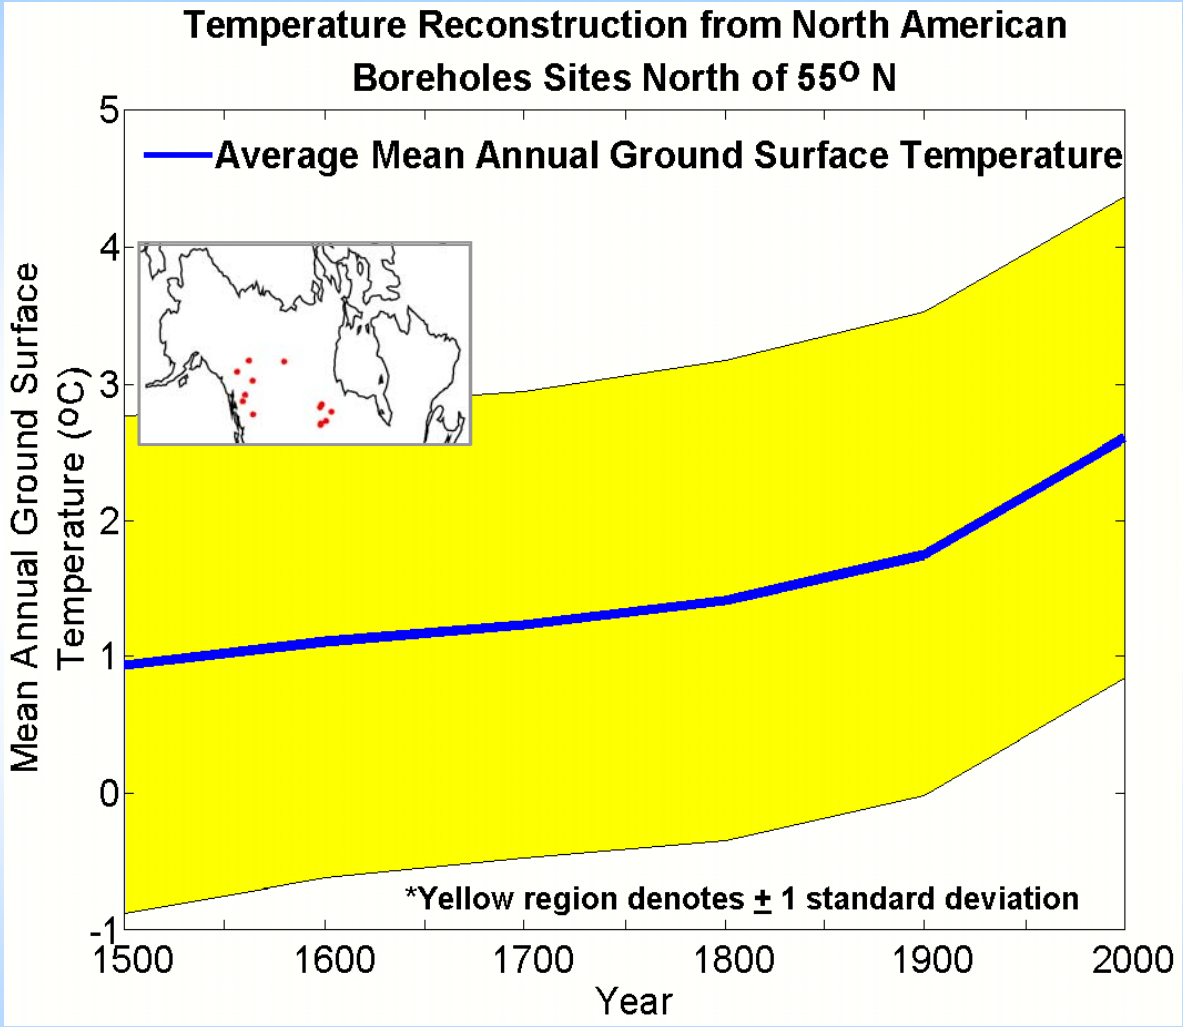
Past Climate From Borehole Records

- 16 borehole temperature records were averaged to create a temperature reconstruction for High Latitude North America
- 20th century temperatures show a major upturn relative to prior 4 centuries
- Temperatures rose at a rate of 1.5°F in the 20th Century



10-15% Decrease in arctic sea ice revealed by NOAA operational satellites

The Global Daily Climatology Network

- Daily observations of max/min temperature and precipitation from approx. 30,000 stations
- Highly variable period of record.
- Available on CD-ROM, soon by FTP.

www.ncdc.noaa.gov/oa/climate/research/gdcn/gdcn.html

Maximum Temperature, Period of Record (POR)

GDCN V1.0

Given that the strongest warming has occurred in the higher latitudes: is the warming occurring in the coldest or warmest days in a given season?

- Kalkstein et al. (1990) found that the coldest airmasses in Alaska and the Yukon appear to show signs of warming
- Others (e.g. Knappenberger et al. 2001) found that the warming in the U.S. appears to be strongest in the coldest days.

Methods

- Take max or min temperature time series at a station for a given month, for the period 1948-2001.
- Determine the 33rd and 66th percentile temperatures to define three bins, 0-33rd, 33rd-66th, 66th-100.
- Place each day into appropriate bin and average the values for a given year-month.
- This defines three temperature time series, one for each bin: coldest, middle, and warmest days for each month.

Methods, cont.

- Create an anomaly series and aggregate up to seasons (DJF, MAM, JJA, SON) and annual.
- Grid anomaly time series into 2.5 by 2.5 Lat/Lon grid.
- Trend analysis of each gridpoint time series.

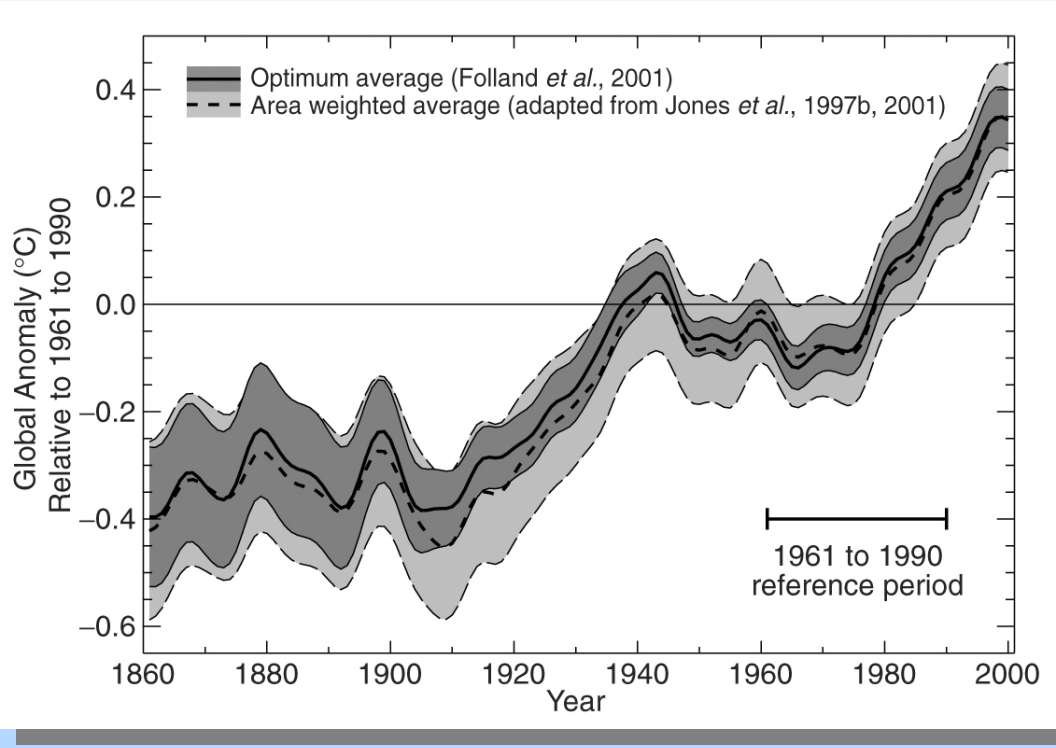
How significant are the uncertainties?

✓ State and Forcings Variables

- Few have quantitative confidence intervals (CIs) (including time-dependent biases) e.g., global surface temperature, CO_2
- Most CIs do not include time-dependent biases
- For many, CIs are uncertain or unknown

✓ Why?

- Examples provide numerous insights into observing and data system deficiencies

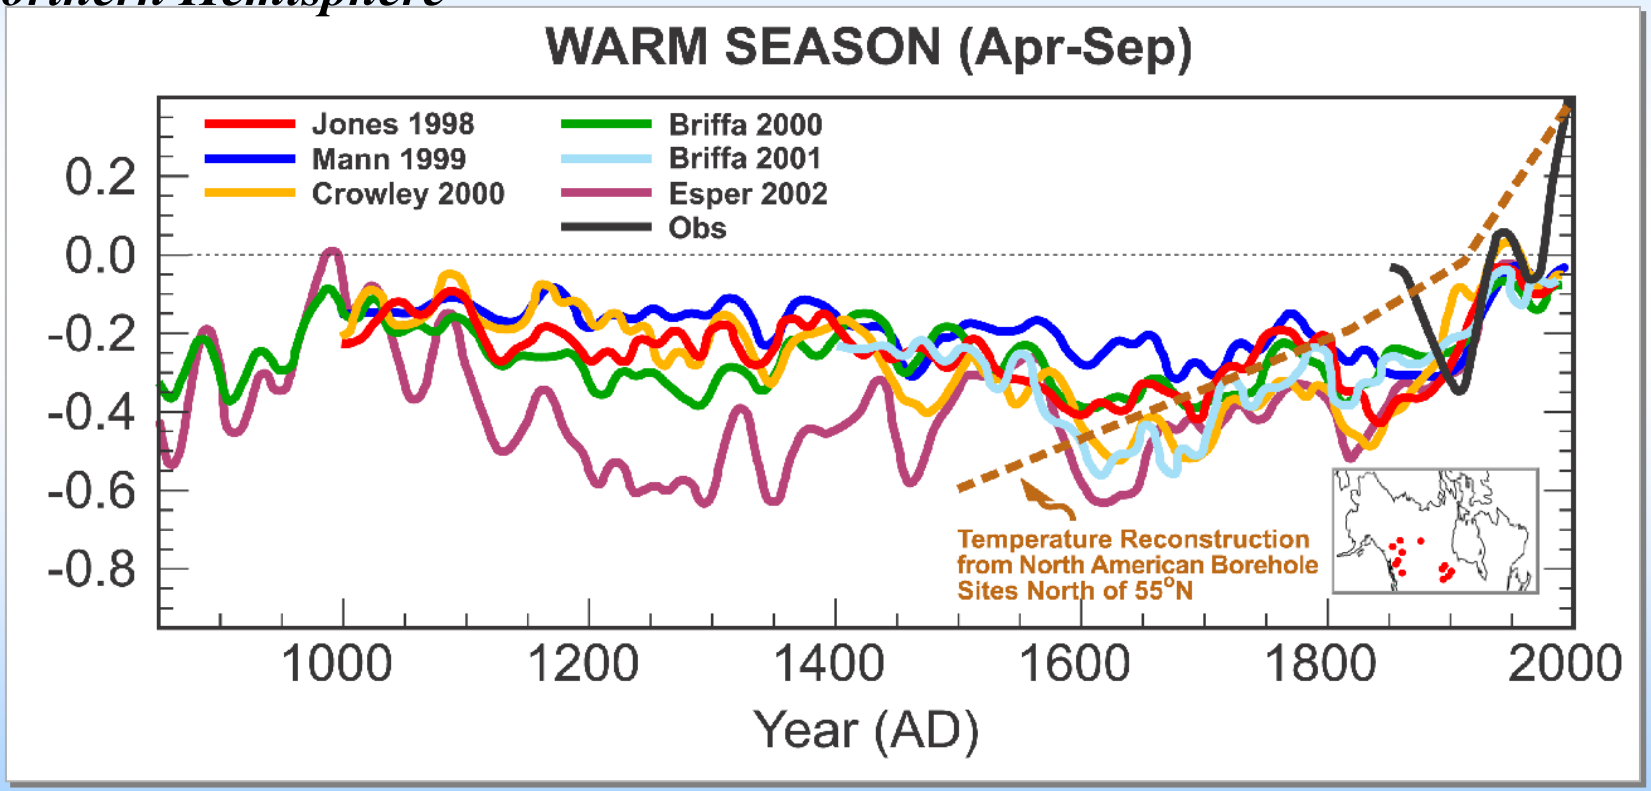


Smoothed annual anomalies of global combined land-surface air and sea surface temperatures (°C).

Differences Among Data Sets / Analyses

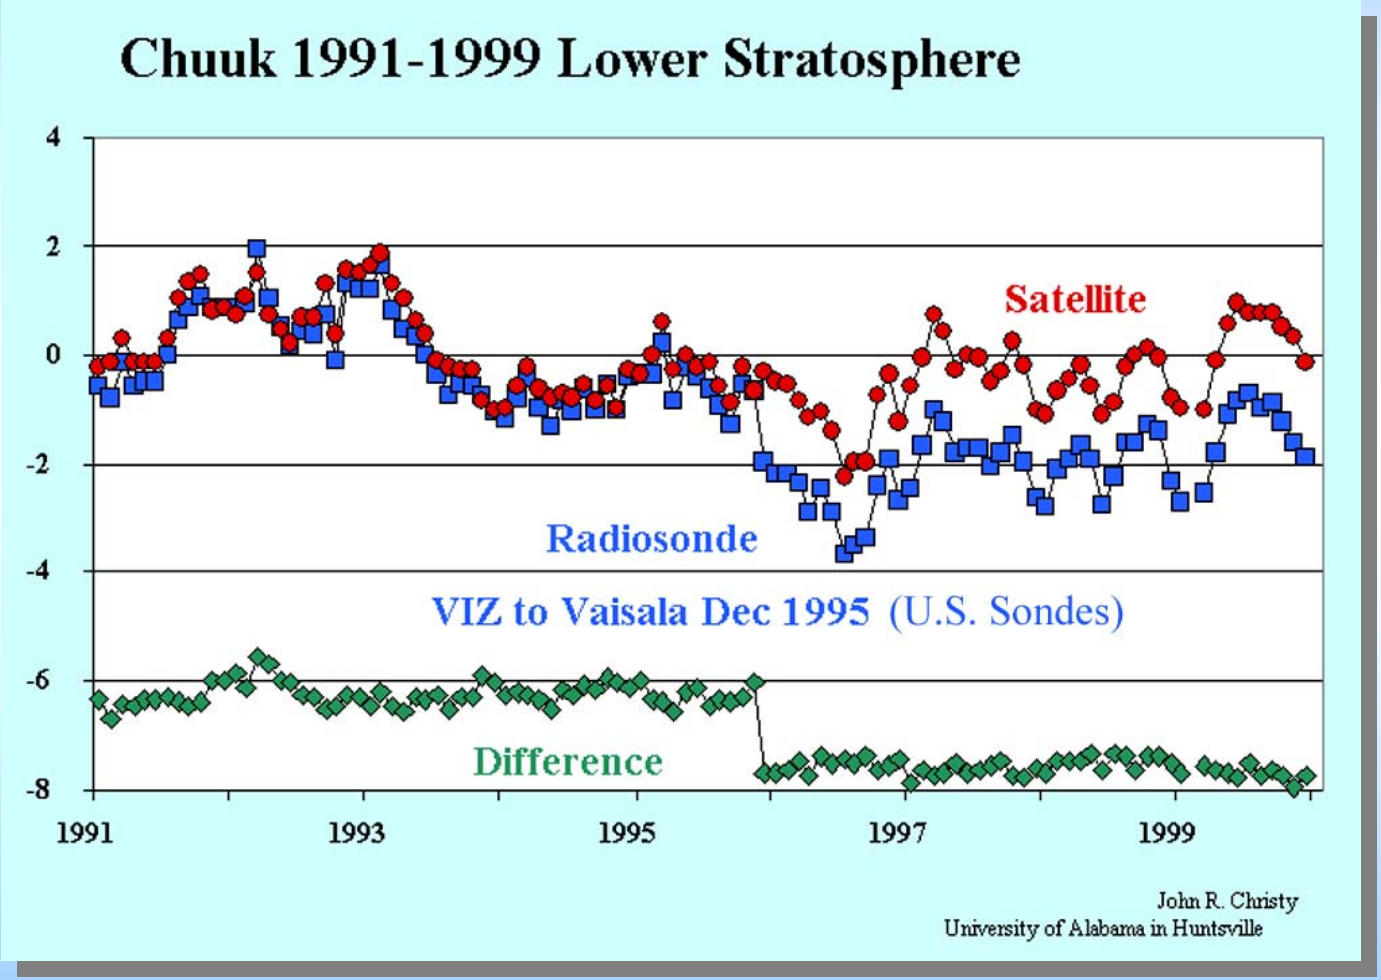
- ✓ **Considerable difference in variability of Paleo data**

Northern Hemisphere



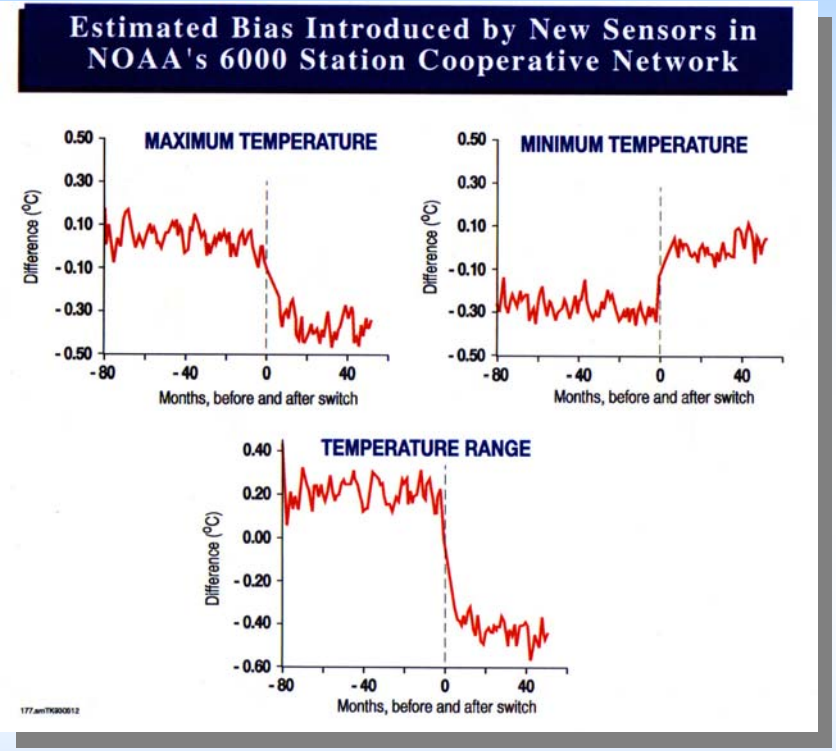
Observing and Data System Deficiencies

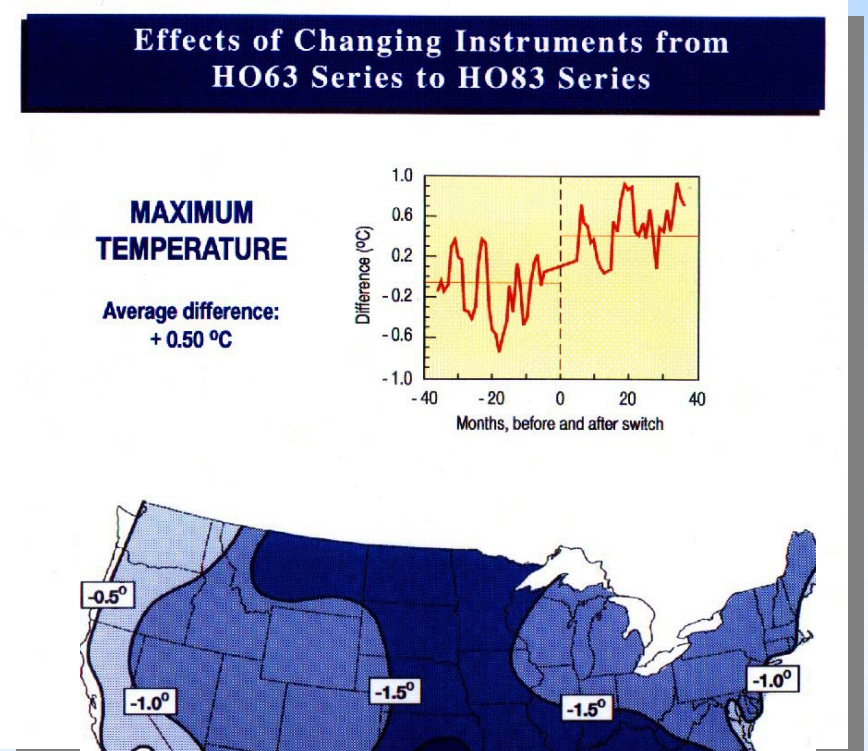
- ✓ Biases in radiosondes detected by satellite data



Observing and Data System Deficiencies

✓ We do not have an adequate Climate Observing System



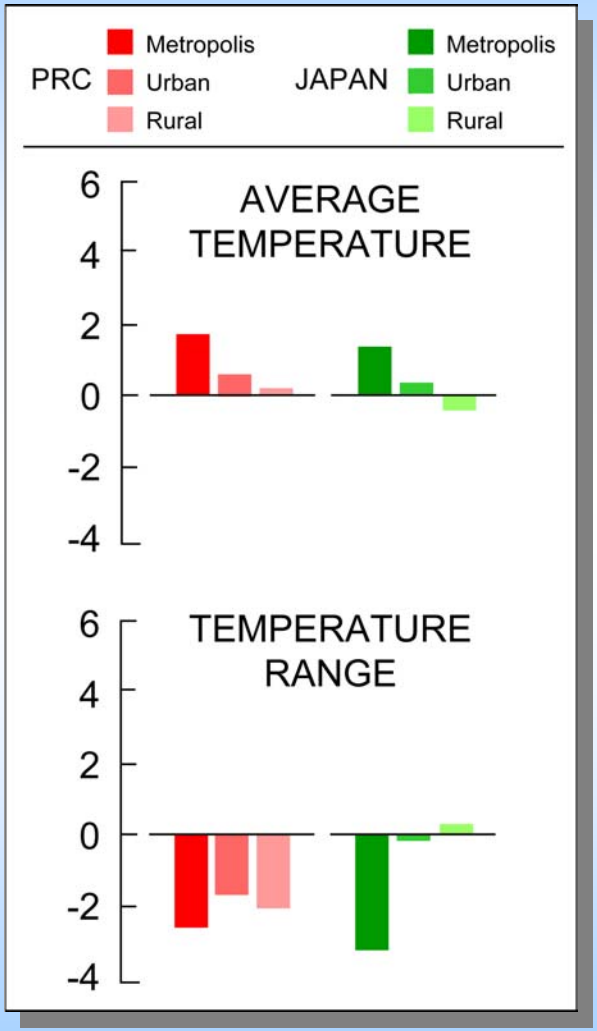


✓ Most observations taken for other purposes, e.g., weather forecasting

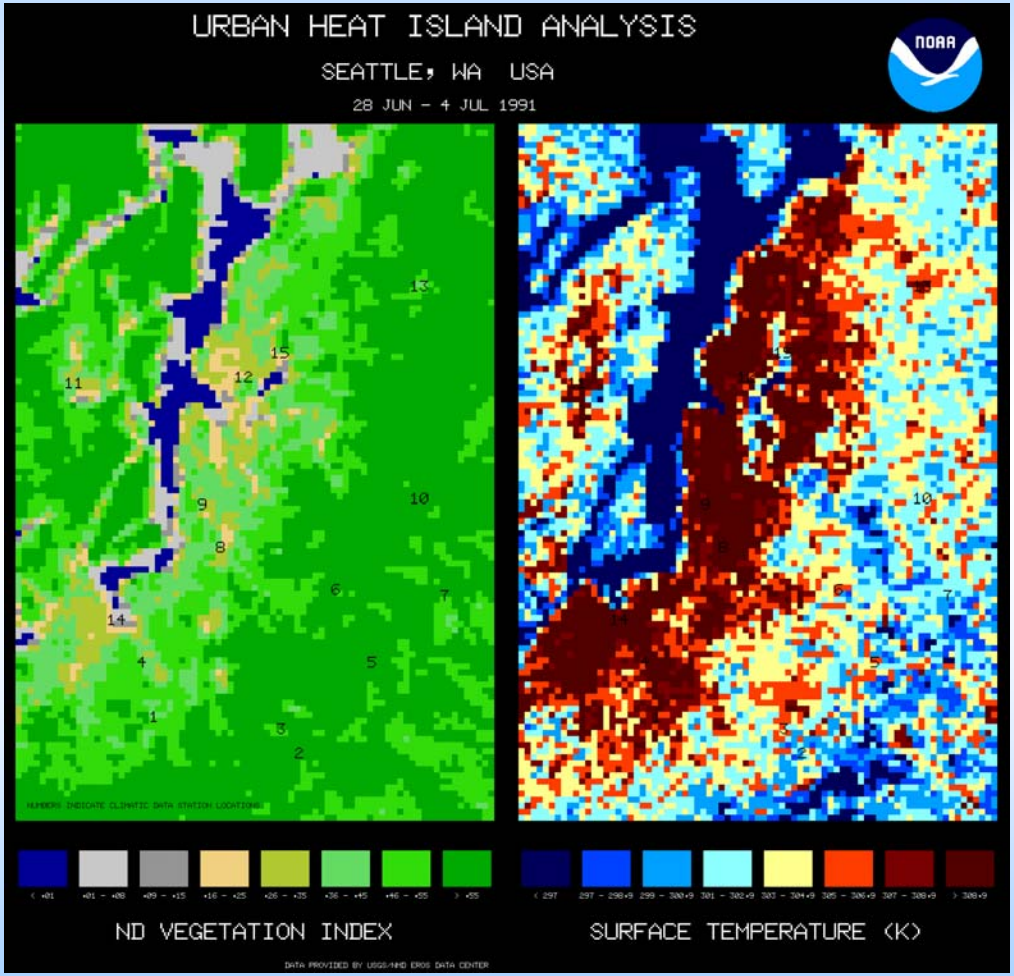
Change in the average March temperatures (°C) resulting from changing the time of observation from 5 P.M. to 7 A.M. local time

Observing and Data System Deficiencies

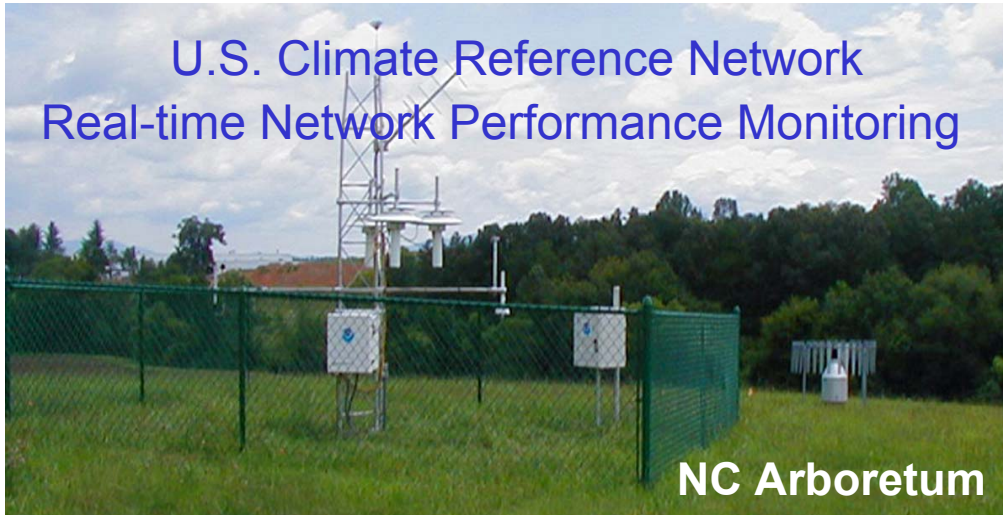
✓ Urban Heat Island Effects

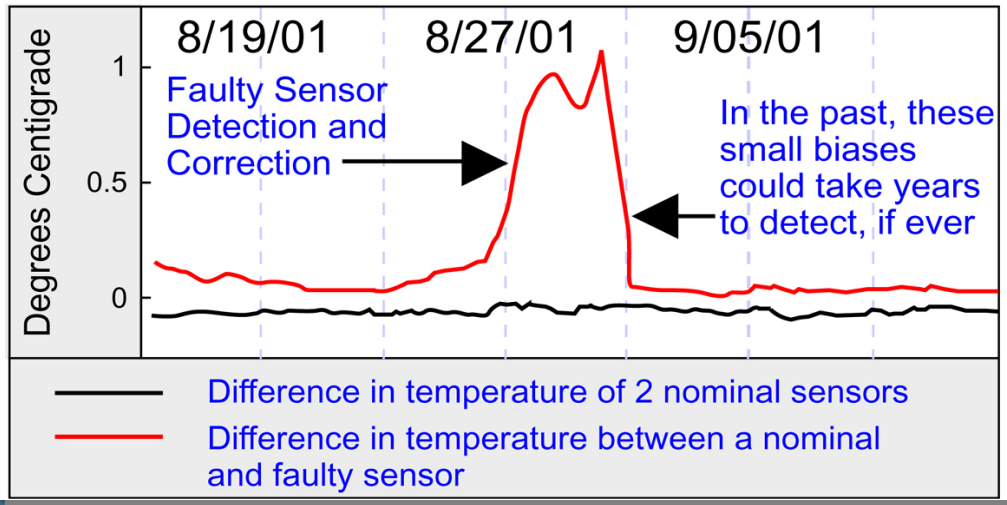


✓ Land use vs temperature

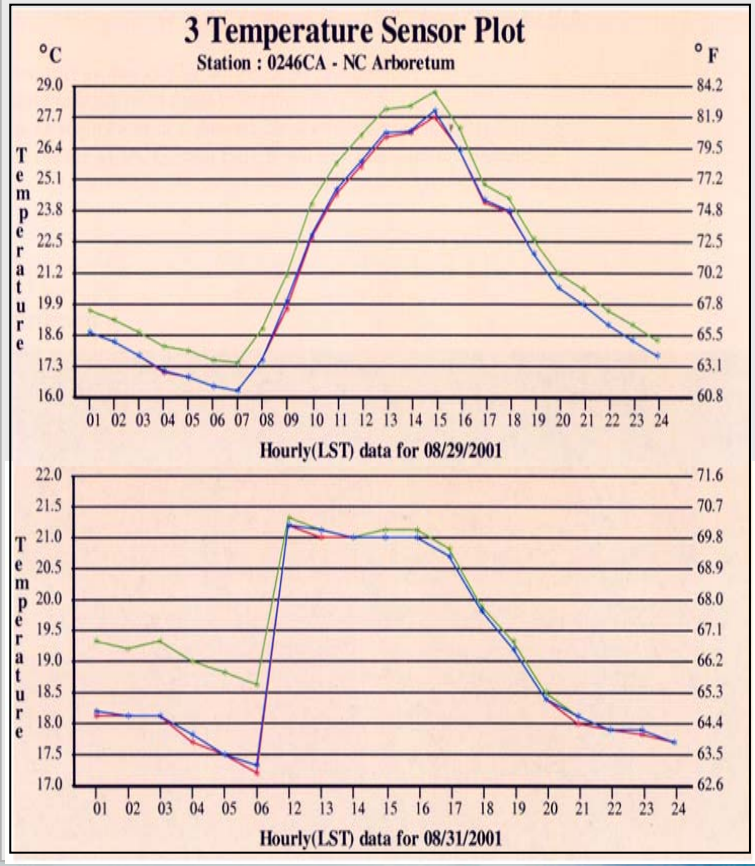


The Climate Observing System: *What is needed?*





High Quality Temperature Measurements



National Climatic Data Center

Summary/Conclusions

- Both maximum and minimum temperatures continue to rise for most of globe now at a faster rate than earlier work. Minimums rising at a faster rate than maximums. A few exceptions (e.g.eastern Canada).
- Strongest warming is in minimum temperatures in Winter and Spring.

Summary/Conclusions

- For most of higher latitude NA, strongest warming is occurring in the coldest days, minimum temperature.
- However, some areas show opposite (e.g. eastern Canada).
- Biggest effect appears to be in Winter, then Spring.
- Some interesting patterns emerge such as the flip-flop in western Alaska, and eastern Canada.
- Why? Is it related to AO, GHGs, some combination?

Summary/Conclusions

- Significant uncertainties remain due to numerous problems with time dependent biases.
- More work is needed to address issues and to develop high quality climate observing systems.
